

Record Activity at Steamboat Geyser

By T.W. Tramm

YELLOWSTONE'S Steamboat Geyser just set a new record for the shortest time ever between observed eruptions: three days, 3 hours and 48 minutes.

According to witnesses, the eruptions were especially large, loud and dramatic, one ejecting a rock that shattered a wooden post.

While experts from the USGS are quick to say that increased activity at a single geyser doesn't indicate any new threat from the Yellowstone caldera—the supervolcano residing beneath the park—they fail to address the fact that this month's outbursts are part of a larger trend of more frequent and violent geyser eruptions, earthquake swarms, and cracks or fissures opening up in and around the area.

Taking a further step back, the unusual activity in Yellowstone is part of a worldwide trend of ominous phenomena increasing in frequency and intensity:

- Earthquakes and volcanism.
- Fires, floods, droughts, and every type of storm.
- Record high-and-low temperatures.
- A rapidly shifting magnetic pole.
- Anomalous solar activity.
- Near asteroid or meteor pass-bys.
- Unexplained booms, grinding, or “trumpet” sounds.
- Mass animal, fish, and bird die-offs.
- Deadly disease outbreaks.
- Threats of war.

Viewed in isolation these phenomena may be explained away as random or no cause for dismay. Viewed as a whole and in the context of Bible prophecy, however, we recognize them to be the final “birth pains” preceding the time of travail Jesus says will be the worst in human history.
